

## **Weekly Diary – Week 6**

Internship Organization: Vikaspedia

Duration: 22/02/2026 – 28/02/2026

### **Objective of the Week**

The main objective of this week was to finalize the chatbot system by improving its user interface and ensuring that the application worked smoothly across different devices and browsers. After integrating the AI functionality in the previous stages, the next step was to refine the overall appearance of the chatbot and make the interface more user-friendly.

During this week, the focus was on enhancing the visual design, implementing responsive layout adjustments, testing the system on multiple browsers, and improving error handling. In addition, the project documentation was prepared so that the project could be easily understood and used by others. The final goal was to make the chatbot system stable, well-documented, and ready for submission.

### **Date – 22 February**

On the first day of the week, I focused on improving the visual design of the chatbot interface. The layout and styling of the chat messages were adjusted to make conversations appear clearer and easier to read.

Changes were made to the spacing, alignment, and typography used in the chat interface. I also improved the styling of the user messages and AI-generated responses so that they could be easily distinguished from each other. These improvements helped make the conversation flow more readable and visually organized for users interacting with the chatbot.

### **Date – 23 February**

On the second day, I worked on making the chatbot interface responsive so that it could function properly on devices with different screen sizes. Since many users access websites from mobile devices, it was important to ensure that the chatbot interface adapts well to smaller screens.

CSS adjustments were implemented so that the chat sidebar automatically resizes according to the screen width. When the application is opened on a mobile device, the sidebar expands to occupy the

full width of the screen for better usability. Testing was performed using mobile view options to confirm that the interface behaved correctly on smaller displays.

#### **Date – 24 February**

On the third day, I carried out cross-browser testing to verify that the chatbot worked properly on different web browsers. The testing was performed on popular browsers such as Google Chrome, Microsoft Edge, and Mozilla Firefox.

During this process, I checked whether the layout of the interface appeared correctly and whether the AI API responses were displayed properly in the chat window. Some small layout differences were noticed between browsers, which were then corrected by adjusting CSS properties to maintain consistency across platforms.

#### **Date – 25 February**

On the fourth day, I implemented error-handling mechanisms within the chatbot system. This was necessary because external AI APIs may sometimes fail due to network connectivity problems or request limitations.

To address this issue, I added error-handling logic in the application so that the system could detect failed API requests. Instead of leaving the user without feedback, the chatbot now displays a clear message informing the user that the response could not be generated at that moment. This ensures that users understand the situation and do not assume that the system is malfunctioning.

#### **Date – 26 February**

On the fifth day, I worked on improving the quality and organization of the application code. The React components were reorganized to make the structure more logical and easier to maintain.

Unnecessary code blocks were removed, and naming conventions were improved to make the code clearer and more readable. In addition, comments were added in important sections of the code to explain how different parts of the system work. These steps help other developers understand the codebase more easily.

**Date – 27 February**

On the sixth day, I prepared the project documentation for the chatbot system. A detailed README file was created to explain the purpose and functionality of the project.

The documentation included information about the project overview, installation instructions, required dependencies, steps for running the project, details of the AI API integration, and any known limitations of the system. This documentation makes it easier for other developers or users to set up and run the project on their own systems.

**Date – 28 February**

On the final day of the week, I conducted complete testing of the chatbot application. This testing included verifying the user interface behavior, checking API integration, and confirming that the message flow between the user and the chatbot worked correctly.

I tested the chatbot using different queries related to webpage content to ensure that the system generated relevant responses. After confirming that everything was functioning properly, I uploaded the final project to GitHub and completed the project submission process.
