

Weekly Diary – Week 15

Internship Organization: Vikaspedia

Duration: 28/04/2026 – 03/05/2026

Objective of the Week

The primary objective of this week was to implement the core keyword extraction pipeline using RAKE-based processing and improve SEO-focused keyword generation. The focus was on extracting meaningful phrases from content and generating optimized long-tail keyword suggestions.

Date – 28 April

Implementation of the RAKE (Rapid Automatic Keyword Extraction) algorithm was started for extracting important key phrases from user-provided content. Candidate phrase generation and phrase segmentation logic were developed and tested.

Date – 29 April

Keyword scoring functionality was implemented to rank extracted phrases based on frequency and relevance. Additional filtering logic was added to eliminate low-quality or repetitive keywords from the generated output.

Date – 30 April

Long-tail keyword generation templates were introduced to create SEO-friendly keyword combinations. Informational, tutorial-based, and intent-driven keyword structures were dynamically generated using extracted content concepts.

Date – 01 May

SEO optimization improvements were added to prioritize readable and natural keyword phrases. Additional validation checks were implemented to ensure that generated keywords remained relevant to the original content context.

Date – 02 May

The backend API endpoint for keyword generation was implemented using Spring Boot REST APIs. Request and response models were created to handle content input, keyword generation settings, and metadata returned to the frontend.

Date – 03 May

Testing of the keyword extraction and optimization pipeline was conducted using multiple content samples. Performance and accuracy of generated keywords were analyzed, and improvements were made to phrase ranking and filtering rules.
